

OBELIUS TECHNOLOGIES

IT Security Policy

Version 1.4 | Confidential — Internal Use Only

Last Updated: January 2026

1. Purpose and Scope

This policy defines the information security requirements for all employees, contractors, and third parties with access to Obelius Technologies systems. Compliance is mandatory. Breaches may result in disciplinary action, up to and including dismissal.

2. Password Requirements

- Minimum length of **12 characters**, combining uppercase, lowercase, numbers, and symbols.
- Passwords must be changed every **90 days**. The system will prompt users automatically.
- Previous 10 passwords may not be reused.
- **Multi-Factor Authentication (MFA)** is mandatory for all company accounts, including email, GitHub, and any cloud service. TOTP apps (e.g. Google Authenticator, Authy) are preferred over SMS.
- Passwords must never be shared, written down, or stored in plain text.

3. VPN Setup — Tailscale

All employees must connect via Tailscale VPN when accessing company systems remotely. To set up:

- 1 Download Tailscale from tailscale.com/download for your operating system.
- 2 Log in using your Obelius Google Workspace account (SSO).
- 3 Contact it@obelius.com to be added to the Obelius tailnet.
- 4 Once approved, your device will appear in the Tailscale admin panel.
- 5 VPN must be active whenever accessing internal systems, GitHub, or Notion outside the office.

4. Approved Software

Only the following software is approved for use on company devices without prior written approval:

- **VS Code** — Primary code editor. Extensions must be from the approved list (see IT portal).
- **Slack** — Internal team communication.
- **Notion** — Documentation and project management.
- **Figma** — Design and prototyping.
- **Google Workspace** (Gmail, Drive, Docs, Sheets, Meet) — Email, storage, and collaboration.

Banned Software

The following categories of software are strictly prohibited on company devices:

- Torrent clients or peer-to-peer file sharing applications.
- Personal cloud storage services (Dropbox, iCloud, personal Google Drive).
- Remote desktop tools not approved by IT (e.g. AnyDesk, TeamViewer).
- Cryptocurrency mining software.

- Any application from an untrusted or unverified source.

5. Data Classification

Classification	Description	Examples
Public	Information approved for public release.	Marketing materials, blog posts
Internal	General business information for employees only.	Internal wikis, org charts
Confidential	Sensitive data with restricted access.	Client data, contracts, salary info
Secret	Highest sensitivity; strictly need-to-know.	Source code, credentials, security keys

6. Laptop Encryption

All company laptops must have full-disk encryption enabled:

- **Windows:** BitLocker must be enabled on all drives. Recovery keys must be uploaded to the IT portal within 24 hours of setup.
- **macOS:** FileVault must be enabled. Recovery keys must similarly be escrowed via the IT portal.
- IT will verify encryption status during device setup and periodically thereafter.
- Unencrypted devices will be removed from the network until compliant.

7. Incident Reporting Procedure

Any actual or suspected security incident must be reported immediately. This includes lost devices, phishing attempts, unauthorised access, or data exposure.

- 1 **Contain:** If a device is lost or compromised, disconnect it from the network immediately if possible.
- 2 **Report:** Contact it@obelius.com immediately — do not wait. For critical incidents, also call the IT emergency line listed on the IT portal.
- 3 **Document:** Record what happened, when, and what systems or data may have been affected.
- 4 **Cooperate:** Work with the IT team during investigation. Do not attempt to fix or investigate independently.
- 5 **Review:** Following resolution, IT will issue an incident report and, where necessary, update policies or controls.
